

# **INFORMATION SECURITY PROJECT**

**SUBMITTED TO: DR. HABIB UR REHMAN**

**SUBMITTED BY: ZUHA JUNAID**

# 1. Executive Summary

The primary goal of this project was to identify and mitigate vulnerabilities in a custom-built academic portal. By employing **DAST**, **IAST**, **SAST**, and **SCA**, we achieved a "defense-in-depth" security posture. The assessment revealed critical misconfigurations such as missing security headers and server banner disclosures.

## 2. Methodology & Tools Used

We utilized a combination of automated and manual testing techniques to ensure comprehensive coverage.

Tool/Method	Description
<b>SAST</b> (Static Analysis)	Analyzes the source code without execution to find hardcoded secrets or unsafe APIs.
<b>DAST</b> (Dynamic Analysis)	Tests the running application from the outside to find runtime flaws like SQL injection.
<b>IAST</b> (Interactive Application Security Testing)	Uses agents to monitor application behavior in real-time during execution.
<b>SCA</b> (Comprehensive Software Composition Analysis)	Identifies vulnerabilities in third-party libraries and open-source dependencies.
<b>Proxy (ZAP/Burp)</b>	Intercepts and modifies HTTP traffic to test input validation and session security.
<b>MACRO Tool</b>	Automates complex multi-step sequences, such as logging in before a scan.
<b>R-Builder</b>	Facilitates the creation of structured security reports for stakeholders.

## 3. Evidence of Security Scanning

The following findings were captured during the OWASP ZAP/DAST scanning process:

### 3.1 Macro Configuration

The project utilized a **Macro Event List** to automate the authentication process for the scanner. This ensures that the DAST tool can access protected pages like the Admin dashboard.

**File Proof (Macro Script Snippet):**

## XML

```
<MacroEvent>
  <EventType>Javascript</EventType>
  <EventTypeName>Click</EventTypeName>
  <Data><![CDATA[ (function(path){ ... })('INPUT[name="age"]', '4') ]]></Data>
  <Step>26</Step>
</MacroEvent>
```

The snippet shows a Javascript event being triggered to interact with the "age" input field during a recorded session.

## 3.2 Vulnerability Findings

- **Missing Referrer-Policy:** The site does not instruct the browser on how much referrer information to share, potentially leaking sensitive URLs to third parties.
- **Content-Security-Policy (CSP) Not Set:** Lack of a CSP increases the risk of Cross-Site Scripting (XSS) and clickjacking.
- **Server Banner Disclosure:** The server reveals its software version (e.g., Microsoft-IIS/10.0), allowing attackers to target version-specific exploits.

## 4. Pros and Cons of the Approach

### Pros

- **Comprehensive Coverage:** Combining SAST (internal) and DAST (external) ensures that both code-level and configuration-level flaws are found.
- **High Accuracy:** Using IAST reduces false positives by correlating runtime data with code analysis.
- **Zero-Cost:** Leveraging OWASP's open-source tools provides enterprise-grade security without licensing fees.

### Cons

- **Slow Scan Times:** DAST scans can be time-consuming, sometimes taking several days for large applications.
- **Complexity:** Managing multiple tools (SCA, SAST, DAST) requires significant expertise to interpret and deduplicate results.

## 5. Conclusion & Recommendations

The academic portal currently has a moderate security risk due to missing HTTP headers and server information disclosure.

**Next Steps:** \* **Implement Security Headers:** Add Content-Security-Policy and ReferrerPolicy to the server configuration.

- **Harden Server:** Disable server banners to prevent version fingerprinting.
- **Continuous Scanning:** Integrate SCA into the build process to catch vulnerable dependencies early.

The screenshot shows the OWASP ZAP interface. At the top, there's a navigation bar with tabs like DAST, IAST, SAST, SCA, Proxy, R-Builder, Cookies, JWT, Decoder, Cheat sheets, and Tools. Below the navigation bar, the main interface displays a table titled "Academic Management System". The table has columns for ID, Name, Role, and Age. There are 7 rows of data. A tooltip on the right side of the interface indicates a "Missing or weak Referrer-Policy" vulnerability with a URL of http://127.0.0.1:8000/.

ID	Name	Role	Age
35	zuhu	Admin	21
36	Simra	Teacher	22
37	aliza	Student	4
40	b	Student	3
41	a	Teacher	22
43	jbjf	Admin	35

  

This screenshot shows the "cURL supported - experimental" feature in the OWASP ZAP interface. It displays a GET request to http://127.0.0.1:8000/. The response status is HTTP/1.1 200 OK, and the response body is the HTML code of the Academic Management System page.

```
<!DOCTYPE html>
<html>
<head>
  <title>Academic System</title>
  <style>
    body { font-family: Arial; padding: 30px; }
    table, th, td { border: 1px solid #ccc; border-collapse: collapse; padding: 8px; }
  </style>
</head>
<body>

<h2>Academic Management System</h2>

<form method="POST" action="/add">
  <input name="name" placeholder="Name" required>
  <input name="age" placeholder="Age" required>
</form>

<table border="1">
  <thead>
    <tr>
      <th>ID</th>
      <th>Name</th>
      <th>Role</th>
      <th>Age</th>
    </tr>
  <tbody>
    <tr>
      <td>35</td>
      <td>zuhu</td>
      <td>Admin</td>
      <td>21</td>
    </tr>
    <tr>
      <td>36</td>
      <td>Simra</td>
      <td>Teacher</td>
      <td>22</td>
    </tr>
    <tr>
